Tosco Branch Re-Entry Wells — Production Potential, Geology & Drilling Execution

Bowman County, North Dakota · Williston Basin southern margin (Red River trend)

Prepared for: Marlo Operating Company · Valor Energy Partners | Wells: Branch 4 RR (#41700) · Branch 2 (#41258)

1	Executive Summary	p. 2
One-page distilled view — probability of a producer, dominant risk, recommended action.		
2	Production-Probability & Execution Report	p. 3
CoS triangulation, risk-retirement dynamics, sensitivity, cross-domain V&V, full citations.		
3	Production Expectation Matrix	p. 7
Well / completion strategies scored on the execution framework; why fracking is wrong for the 'B'.		
4	Geologic / Geosteering Window Report	p. 8
Stratigraphic pay window, geosteering cross-section, MWD-gamma steering playbook.		
5	Drilling Execution Forecast	p. 10
Geometry × geology section-by-section; risk-by-phase (mechanical / geological / fluid).		
6	Fluid Balance — Loss & Gain Risk	p. 11
Mud / ECD vs formation pressure; the narrow window in the pay; loss & gain mitigation toolkit.		
7	Steering Anticipation at Scale	p. 12
Anticipatory geosteering with a fleet-learned dip prior; ~95% footage held in-zone.		

HOW TO READ THIS PACKAGE

Start with the Executive Summary (1) for the bottom line. Documents 2-3 answer “will it produce and with which completion”; document 4 answers “where to drill”; documents 5-7 answer “how the well will drill” — mechanics, fluid balance, and steering. Scope is the probability of a producing well and how to execute it — not economics.
